

The device has a standalone transmission.

According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distances≤ 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)]·[ $\sqrt{f(GHz)}$ ]  $\leq 3.0$ 

The maximum tune-up limit power is 8.62 dBm(7.28mW) @ 2.462 GHz For the head and body SAR, use 5mm as the conservative minimum test separation distance, [(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)]·[ $\sqrt{f(GHz)}$ ] =  $2.284 \le 3.0$ 

So standalone SAR measurements are not required for both head and body.
