MPE Calculation Method

Device is a net book, which antenna locates on the top of the display. The distance between antenna and keyboard is 20.7 cm > 20 cm (please refer to EUT external photo document), RF exposure evaluation applied.

E (V/m) = (30*P*G)$^{0.5}$/d

Power Density: Pd (W/m2) = E^2/377

E = Electric Field (V/m)

P = Peak RF output Power (W)

G = EUT Antenna numeric gain (numeric)

d = Separation distance between radiator and human body (m)

The formula can be changed to

Pd = (30*P*G) / (377*d^2)

From the peak EUT RF output power, the minimum mobile separation distance, d=0.2m, as well as the gain of the used antenna, the RF power density can be obtained.

Calculated Result and Limit(WORSE CASE IS AS BELOW)

Antenna Gain (Numeric)	Peak Output Power (mW)	Power Density (S) (mW/cm2)	Limit of Power Density (S) (mW/cm2)	Test Result
1.585 (2dBi)	56.624 (17.53 dBm)	0.018	1	Compiles
